

Top-level Architecture:

Environment:

On laptop:

On Server:

```
afsaccess4-44 udpradio >: ./udpradio 10.200.49.2 2345 k.mp3 5000
```

Steps:

1. Create a UDP socket and bind on the server
2. Build the host's internet address (use the cmdline arguments hostname and port)
3. Open file
4. Read file and send the message to server (packet size 1024 bytes and delay from the cmdline argument)
